Conclusion of Clinical and Radiographic Exams

Following the examinations carried out today, our findings regarding the health status of this horse with a view to its intended future use are as follows:

☒ **0**
Absence of clinical anomaly or lesion incompatible with intended use.

☒ **1**
Presence of minor abnormality, frequently encountered in horses performing well in the discipline envisaged.

☒ **2**
Presence of clinical abnormality or lesions that may be encountered on horses performing well in the discipline envisaged, the management of which requires appropriate medical and/or surgical care and/or special shoeing.

☒ **3**
Presence of clinical abnormality or lesions likely to compromise the horse's future use.

Recent studies show that the average X-RAYS score of a 3-year-old population of sport horses is close to 5.

The conclusion of these exams results from the conditions under which the examination was carried out. It is established on the basis of a clinical and/or radiographic examination only. It does not prejudge the future evolution of the horse's condition, nor its ability to perform at the level envisaged. This certificate does not engage the responsibility of the veterinarian beyond the findings recorded on the day of the examination.
